

Use satellite imagery to identify and monitor Rapid Support Forces (RSF) facilities, supply routes, equipment movements, and possible launch or support sites in Sudan and neighboring border areas. The priority is to distinguish RSF-linked activity from Sudanese Armed Forces (SAF) positions, civilian logistics, and normal commercial traffic.

This should be treated as an indicators-and-patterns effort: no single image is likely to prove ownership or intent. Confidence should increase only when multiple signs—such as vehicle types, security layouts, convoy movement, construction, repeated flight activity, and corroborating reporting—line up over time.

1. RSF sites inside Sudan

Focus on non-SAF military or security compounds that could be operated, guarded, or used as logistics nodes by the RSF.

Look for:

- Compounds outside formal Sudanese Army garrisons, especially near major roads, airports, warehouses, industrial zones, border crossings, and former government or paramilitary facilities.
- Newly occupied sites showing vehicle buildup, defensive berms, checkpoints, guard posts, trenching, revetments, or perimeter changes.
- Warehouses, yards, farms, commercial compounds, and abandoned facilities that have been converted into military-use locations.
- Sites with a high concentration of pickup trucks, technicals, armored vehicles, fuel tankers, cargo trucks, and other transport assets.
- Areas where vehicle parking, tent camps, storage areas, or defensive works expand rapidly over days or weeks.
- Repeated vehicle movement between suspected RSF sites and airfields, border routes, ports, depots, or urban front lines.

Potential armories and storage facilities

Prioritize locations that could serve as weapons, ammunition, fuel, or drone-equipment storage:

- Large enclosed warehouses with new security features, earth berms, blast walls, or restricted vehicle access.
- Compounds with container stacks, covered storage, newly built sheds, or unusual truck traffic.
- Storage yards with repeated arrivals of cargo trucks and departures of smaller military vehicle groups.
- Areas where cargo is moved from containers or trucks into secured buildings or dispersed storage points.
- Newly excavated trenches, hardened shelters, revetted storage, or dispersed vehicle parking that may be intended to reduce vulnerability to airstrikes.
- Sites close to roads or airfields but far enough from dense civilian activity to support

discreet unloading and redistribution.

Containers, boxes, and cargo traffic should be logged as potential military logistics only when supported by context—for example, military security, convoy escort, movement into a known RSF area, or a consistent link to armed-vehicle concentrations. Containers alone are not evidence of arms transfers.

2. Flights and possible air resupply

Identify airfields, airstrips, and improvised landing areas that may support RSF logistics or external resupply.

Monitor:

- Civilian or secondary airfields showing unusual cargo aircraft activity, especially repeated arrivals followed by truck convoys.
- Aircraft parked at remote strips, temporary airstrips, or nonstandard apron areas.
- Sudden construction or improvement of runways, taxiways, aircraft parking areas, fuel storage, or access roads.
- Cargo trucks, forklifts, container movement, fuel tankers, and security forces appearing soon after aircraft arrivals.
- Aircraft unloading patterns followed by movement toward suspected RSF compounds, warehouses, or border routes.
- Dirt strips or cleared areas long enough for fixed-wing aircraft, particularly near RSF-held territory, supply corridors, or isolated logistics hubs.

Key analytical question: Where do aircraft arrive, what ground vehicles meet them, and where do those vehicles go afterward?

3. Drones, launch sites, and counter-drone equipment

Look for potential RSF drone operations, but avoid treating ordinary vehicles or communications equipment as proof of drone activity without corroboration.

Possible drone launch or control locations

Prioritize:

- Open compounds, farms, airstrips, isolated buildings, or cleared ground near front lines or major RSF concentrations.
- Repeated vehicle activity at small airstrips or open areas that do not otherwise support regular civilian aviation.
- Locations with temporary shelters, generators, antenna masts, command vehicles, and small support convoys.
- Small fixed-wing aircraft, large quadcopters, launch rails, catapult-like equipment, or unusual crates and ground support material where image resolution allows.
- Sites showing repeated use but limited heavy logistics—consistent with mobile reconnaissance or strike-drone teams.
- Areas near known or suspected targets, including SAF bases, airfields, supply routes, or

urban defensive positions.

Possible electronic warfare or jamming equipment

Potential drone-jamming or electronic-warfare equipment may be difficult to identify from satellite imagery alone. Look for supporting indicators rather than assuming any antenna is a jammer:

- New mast arrays, directional antennas, radar-like systems, or communications vehicles positioned near high-value RSF sites.
 - Equipment placed on rooftops, ridgelines, airfields, logistics hubs, or defensive perimeters.
 - Generator vehicles, antenna trailers, radomes, or specialized electronic-support vehicles appearing alongside command posts.
 - Repeated relocation of vehicles or antenna systems in response to nearby drone strikes.
- Any suspected jamming system should be labeled low-to-moderate confidence unless imagery clearly shows identifiable equipment or it is corroborated by reliable reporting, photos, video, or signals-related evidence.

4. RSF armored and military vehicle movements

Track significant changes in RSF-controlled or RSF-associated vehicle inventories and concentrations.

Watch for:

- A sudden rise in technicals, armored personnel carriers, armored cars, military trucks, artillery tractors, fuel tankers, or recovery vehicles.
- Vehicle parks expanding at suspected bases, warehouses, roadside compounds, or urban staging areas.
- Convoys moving from border areas, airfields, or storage facilities toward fighting fronts.
- New arrivals of vehicles that differ from the local baseline in type, paint scheme, configuration, or condition.
- Vehicles entering Sudan from external routes and later appearing near RSF-controlled areas.
- Movement from an apparent arrival point to a distribution hub, then onward to operational fronts.

The main goal is to establish a movement chain:

$\text{Import or arrival point} \rightarrow \text{staging area} \rightarrow \text{storage/logistics hub} \rightarrow \text{RSF operational area}$

For every notable buildup, record:

- First observed date.
- Estimated vehicle count and vehicle categories.
- Location and coordinates.
- Change from the previous image.
- Likely arrival route.

- Nearby warehouses, airfields, roads, or border crossings.
- Any later movement toward front-line areas.

5. Damage to suspected RSF sites

Assess suspected SAF airstrikes, drone attacks, or other attacks against RSF-linked positions.

Look for:

- Fresh impact craters, damaged roofs, burn scars, destroyed vehicles, damaged hangars, or collapsed warehouses.
- New debris fields, smoke damage, scorched ground, or disturbed earth around vehicle parks and storage compounds.
- Changes in vehicle dispersal after an attack, including movement from concentrated parking into tree cover, residential areas, revetted positions, or smaller dispersed sites.
- Rapid repairs, replacement structures, new berms, covered parking, or relocation of logistics activity.
- Evidence that a site remains operational after an attack, such as continued vehicle traffic, new deliveries, reconstruction, or renewed use of airfield facilities.

Avoid attributing a strike to SAF solely from damage patterns. Attribute only when timing, location, public claims, verified reporting, or other evidence supports it. Otherwise use language such as: “damage consistent with an air or drone strike” or “recent explosive damage of undetermined origin.”

Cross-Border Priority Areas

Kurmuk area, Ethiopia

Monitor the area near Kurmuk and the Sudan–Ethiopia border for any unofficial or non-Ethiopian military facility that could potentially support RSF-linked activity.

Key indicators:

- A new or recently expanded compound outside known Ethiopian National Defense Force or local security facilities.
- Foreign-looking or nonstandard vehicle concentrations, especially technicals, cargo trucks, fuel tankers, armored vehicles, or vehicles moving toward Sudan.
- Newly built perimeter walls, checkpoints, berms, tents, warehouses, or vehicle shelters.
- Airstrip improvements, cleared launch areas, unusual small-aircraft activity, or recurring use of isolated open ground.
- Cargo arriving at a border-area site and later moving west toward Sudan.
- Antenna systems, generators, mobile command facilities, and open areas that could support drone teams.

Important caution: An unofficial compound near Kurmuk is not automatically RSF-linked. It could be Ethiopian federal, regional, local militia, commercial, humanitarian, or other cross-border activity. Treat RSF attribution as tentative unless the site has direct movement links to RSF territory, matching vehicles, reliable reporting, or other corroboration.

Libya–Sudan corridor

Identify the likely entry point or route through which fighters, vehicles, supplies, and potentially weapons move from Libya into Sudan.

Focus on:

- Border crossings, remote desert tracks, fuel stops, wells, airstrips, and logistics settlements along the Libya–Sudan route.
- Recurrent convoys moving south or southeast from Libya toward Darfur, especially truck columns accompanied by technicals or security vehicles.
- Staging compounds near the border where cargo is transferred between long-haul trucks, pickups, and military-style vehicles.
- Airstrips or remote landing areas that can support cargo movement into the desert corridor.
- Sites where personnel, vehicles, and containers arrive, wait, refuel, or split into smaller convoys before entering Sudan.
- Possible links between Libyan facilities, border staging points, and RSF-held areas in Darfur.

The objective is to map the full logistics chain:

\text{Libyan origin or staging point} \rightarrow \text{desert transit route} \rightarrow \text{Sudan entry point} \rightarrow \text{Darfur logistics hub} \rightarrow \text{RSF-controlled area}
